Abstract

Young Women Breast Cancer Care (YWbcc): It is NGO, built in South Korea, 2018 with hundreds of members who currently has or had breast cancer in their age from 19 to 37. This organization aims for supporting the breast cancer patients' career return, enhancing quality of life, updating recent and trustworthy information that patients need and want, and customized consultation to the patients in diverse ways including rehabilitation program.

With these programs, YWbcc is focused on the post management issue and reduce the young age patients in late stage. Since the most breast cancer patients in young age concern a lot of their recurrence or relapse, almost of them reluctant to continue their career or social activities voluntarily and by others. (As of 2019, survey of our members) To reduce their own worries and connect them well to the society with our career interrupted program, we want them to go back to the normal life and continue to have personal life without fear or burden as the cancer survivor.

Not only the patients insight, the social recognition of breast cancer survivor also need to be changed positively and widely open up to embrace. YWbcc is trying to provide diverse campaign as the patients level to the society.

Conclusion: In light of the fairly meager information accessible, it very well may be reasoned that KS patients are at an expanded danger of creating bosom malignant growth. The most persuading information appear to help that this hazard might associate with 20-30-crease higher than anticipated. This hazard, albeit raised, is still significantly lower than that of ladies in everyone. The degree of supreme danger of MBC among KS quiet doesn't legitimize prophylactic mastectomy, yet underpins the requirement for persistent instruction, month to month bosom self-assessments and intermittent physical assessment. Despite the fact that mammography has been demonstrated to be helpful in the analysis of MBC (29), it is troublesome right now to decide if this ought to be utilized among KS patients. There is unmistakably a requirement for extra investigations to additionally comprehend the greatness of danger of bosom disease among KS patients and to decide if there are sure factors that may most firmly foresee hazard.

Biography:
